# =====
# ULTIMATE NEXT.JS STARTER — FULL INSTALL
# Run this in the folder where you want your project
# =====

# 1. Create Next.js app with all options
npx create-next-app@latest my-app \
  --typescript \
  --tailwind \
  --eslint \
  --app \
  --src-dir \
  --import-alias "@/*" \
  --yes

cd my-app

# 2. Install all dependencies
npm install \
  framer-motion \
  lucide-react \
  next-themes \
  clsx \
  tailwind-merge \
  class-variance-authority \
  sharp \
  @radix-ui/react-slot \
  @radix-ui/react-dialog \
  @radix-ui/react-navigation-menu \
  @radix-ui/react-dropdown-menu \
  @radix-ui/react-tooltip \
  @radix-ui/react-accordion \
  @radix-ui/react-tabs

# 3. Install shadcn/ui (interactive — just hit Enter through the prompts)
npx shadcn@latest init

# 4. Add the shadcn components you'll actually use
npx shadcn@latest add button card badge dialog sheet tabs accordion tooltip

# 5. Install dev tools
npm install -D \
  prettier \
  prettier-plugin-tailwindcss \
```

@types/node

Use this repository as a Codex plugin source. The Codex manifest lives at:

```
.codex-plugin/plugin.json  
typeui (.) sh/design-skills
```

Install the best uxdesigner skills to exist to make sure this site does not look like vibe coded slop i want it to have its own unique look based upon the business, there should be custom svgs not emojis made for the business type that will attract clients and keep them scrolling without reducing site performance

```
npx impeccable install  
Copy  
First run  
/impeccable init  
Copy  
Update  
npx impeccable update
```

Make sure u use cool css react scroll animations to increase page screen time i dont want people to leave

Use 21st.dev cards and read each picture and make sure there framed and organized well make sure the pictures arent too zoomed in

Use layers with a tighter system: flatter surfaces, sharper framing, poster-safe image handling, and a docked two-button action bar that won't collide on mobile or desktop the site should not look like ai slop use high quality non ai slop front end skills and designs to design a site with aniamtions and svgs related to the website topic.

6. Install GitHub CLI (Mac)

```
brew install gh
```

8. Verify the build is clean

```
npm run build
```

9. Start dev server

```
npm run dev
```

```
npm i @react-spring/web
```

- `page-audit` — 7-dimension audit of any URL, with competitor research
- `content-brief` — writer-ready brief from a target keyword, with SERP gap analysis
- `write-content` — complete SEO article with the full anti-AI-slop ruleset
- `improve-content` — rewrite an existing page with better structure and voice
- `keyword-deep-dive` — single-keyword opportunity analysis with 90-day ranking plan
- `semantic-gap-analysis` — exact entities and subtopics missing from your page vs. the top 3
- `eeat-audit` — score Experience, Expertise, Authoritativeness, Trustworthiness with specific fixes
- `topic-cluster-planning` — hub-and-spoke architecture from a seed topic, with publishing order
- `featured-snippet-optimizer` — rewrite your answer block to win the snippet for a keyword you already rank for
- `linkbuilding` — phase-appropriate tactics (foundation, growth, authority) from domain reading
- `expert-interview` — extract first-party expertise through targeted questions, feeds into content writing

Rank #1 seo get to top 20 on Google AND Bing for your core category keywords

- structure pages with answer-first paragraphs, FAQ schema, clear H2/H3
- hierarchy

ship original data, statistics, and source citations (Princeton's GEO study found each lifts AI visibility 30-40%)

all had bigger domains and more backlinks.

Restructure the content with answer-first formatting, structured Q&A blocks, and freshness signals.

Make sure their service line pages have answer-first structure, current data, or schema markup.

identify the source-preference gaps, restructure your top pages for selection signals.

Project.json add this so it can load on vercel

Generic Website Template

Use this file as a fill-in template for any local service business site built with the same layout style.

Brand Info

- Business name:
- Short name:
- Industry:
- Service area:
- Phone:
- Email:
- Website:
- Primary booking link:
- Instagram:
- Facebook:
- Google reviews link:

Homepage Structure

1. Hero

- Headline:
- Subheadline:
- Main promise:
- Primary call to action:
- Secondary call to action:
- Trust line:
- Hero image 1:
- Hero image 2:

2. Quick Trust Strip

- Short list of services:
- Review count or rating:
- Same-day or fast-response note:
- Local service area note:

3. Simple Process

Use a 3-step layout.

- Step 1 title:
- Step 1 description:
- Step 2 title:
- Step 2 description:
- Step 3 title:
- Step 3 description:

4. Services Grid

Use 4 to 6 service cards with image, title, summary, and example items.

- Service 1:
- Service 2:
- Service 3:
- Service 4:
- Service 5:
- Service 6:

5. Proof Section

- Short section title:
- Short proof paragraph:

- Gallery images:
- Before image alt text:
- After image alt text:

6. Reviews Section

- Section title:
- Review intro copy:
- Review 1 quote:
- Review 2 quote:
- Review 3 quote:

7. Gallery Section

- Gallery title:
- Gallery intro copy:
- Number of images:
- Preferred image style:
- Preferred caption style:

8. FAQ Section

Add 4 to 6 questions.

- FAQ 1:
- FAQ 2:
- FAQ 3:
- FAQ 4:
- FAQ 5:

9. Final CTA

- Final headline:
- Final support sentence:
- Final CTA button:
- Final phone CTA:

Footer Structure

- Logo:
- Short brand line:
- Navigation links:
- Services links:
- Contact details:
- Social icons:
- Copyright line:

Image Rules

- Use real job photos whenever possible.
- Prefer clear before and after pairs.
- Remove text-stamped or overlay-heavy images if cleaner originals exist.
- Use descriptive alt text that explains the scene, not just the file type.
- Keep the image framing consistent across pages.

Content Rules

- Keep copy direct and local.
- Mention the city or region often.
- Show proof before asking for trust.
- Use simple, high-converting CTAs.
- Avoid generic stock-photo language.

Layout Rules

- Hero first, proof second, services third.
- Keep sections short and scannable.
- Use a strong visual hierarchy.
- Reuse the same layout pattern for each new company.
- Fill in company-specific text, photos, links, and service names only.

Fill-In Checklist

- Replace all business names.
- Replace all phone numbers and booking links.
- Replace all social links.
- Replace all review data.
- Replace all service areas.
- Replace all images and alt text.
- Replace all service descriptions.
- Replace all FAQ answers.
- Replace all footer links.

Audit of search console data

- ⇔ Technical SEO audit
- ⇔ Page indexing audit
- ⇔ Performance and rendering audit
- ⇔ Content audit
- ⇔ Link audit & brand authority review
- ⇔ User experience & behavioural audit

2. We create segments to analyse where the losses are

- ⇒ Brand vs Non Brand
- ⇒ Sub Folder performance segment
- ⇒ Last 3 months YoY click gap analysis
- ⇒ Pre and post core update loss segment

3. We rule out issues

- ⇒ Spam issues (content, links)
- ⇒ Technical SEO issues
- ⇒ Indexing issues
- ⇒ Content quality, engagement, NLP, value issues
- ⇒ Link quality & accrurement issues

4. We identify where the weaknesses are:

Technical SEO:

- ⇒ Page rendering
- ⇒ Internal links
- ⇒ Internal anchors, relevance and consistency
- ⇒ URL constructs and architecture
- ⇒ Directive utilisation
- ⇒ HTTP headers
- ⇒ On page elements

Content:

- ⇒ Content performance by segment
- ⇒ Content quality (writing, style, depth, coverage, tov)
- ⇒ Content age, currentness, accuracy
- ⇒ NLP performance
- ⇒ Engagement performance (scroll, click, engagement metrics)
- ⇒ Information priority

⇒ Readability

Links:

- ⇒ Domains with traffic
- ⇒ Accrue ment rate
- ⇒ Anchor utilisation
- ⇒ Top page ext RD distribution
- ⇒ Topical trust flow
- ⇒ Link network analysis

Indexing:

- ⇒ Review non indexed page reasons
- ⇒ Clean up non indexed pages & validate
- ⇒ Maintain healthy indexing

GSC:

- ⇒ Review host, robots.txt accessibility
- ⇒ Review crawl stats
- ⇒ Review disavows
- ⇒ Review all data

5. We create a recovery strategy for clients that can run in parallel so:

- ⇒ Who works on technical fixes, prioritise highest impact items first
- ⇒ Who works on content, we work with & train writers & provide content
- ⇒ Who works on link building / link earning
- ⇒ What strategic items are dealt with first for fastest impact
- ⇒ What's the approval & sign off process
- ⇒ Key KPIs for measurement (query counts, rankings, non brand clicks impr)

6. We then work with clients on:

SEO Implementation:

- ⇒ Get technical fixes done and log annotations
- ⇒ Get content adjustments underway and on a planned schedule
- ⇒ Get link earning underway with a proper link strategy
- ⇒ Get SEO testing underway
- ⇒ Get indexing cleanups done

SEO Measurement:

- ⇒ Log annotations for each thing fixed
- ⇒ Track query counts across URLs, URL Groups and Domain
- ⇒ Track recovery and identify what is and isn't working
- ⇒ Monitor and track new content production
- ⇒ Monitor and track links

Engagement & User Behaviour

- ⇒ Track how people engage with content
- ⇒ Microsoft Clarity + GA4 review
- ⇒ Regular content assessments
- ⇒ UX / content adjustment tests
- ⇒ Maximise positive engagement
- ⇒ Maximise conversion and ROI

We've seen the devastating impact ranking and traffic losses can have on businesses.

We're specialists in ranking & traffic recovery for all types of loss:

- ⇒ Manual actions & penalties
- ⇒ Algo related losses
- ⇒ Spam attacks and hacks
- ⇒ Indexing issues
- ⇒ and lots more

THE ULTIMATE RANK #1 SEO PROMPT

Drop this into any AI. Fill in the brackets. Get a complete SEO fix for any website.

HOW TO USE

1. Copy the entire prompt below
2. Replace every [BRACKETED] field with your client's real info
3. Paste it into Claude, ChatGPT, or any AI
4. The AI will return a complete, actionable SEO roadmap — no back-and-forth needed

You are a world-class SEO strategist. Your job is to perform a complete, end-to-end SEO audit and optimization plan for the following website. Cover EVERY layer: technical, on-page, content, local, backlinks, schema, and Google Search Console strategy. Do not summarize — go deep on each section with specific, actionable fixes. Think like someone whose income depends on this site ranking #1.

WEBSITE DETAILS

Website URL: [https://yourwebsite.com]

Business Name: [Business Name]

Industry / Niche: [e.g. HVAC, Law Firm, Web Design Agency, E-commerce, SaaS]

Primary City / Service Area: [e.g. Atlanta, GA] (leave blank if national/global)

Target Customer: [Who is the ideal buyer? e.g. homeowners aged 35-60 in suburban Atlanta]

Top 3 Services or Products: [List them]

Main Goal of the Website: [Leads / Sales / Bookings / Traffic / Brand Awareness]

Current Biggest Problem: [e.g. No traffic, rankings dropped, low conversions, not indexed]

Top Competitor URLs: [Paste 2-3 competitor URLs]

Primary Keyword to Rank #1 For: [e.g. "web design Atlanta"]

PART 1 — KEYWORD STRATEGY

1. Based on the business details above, give me:

- 5 HIGH-PRIORITY transactional keywords (buyer intent, ready to purchase) with estimated monthly search volume and keyword difficulty rating (easy / medium / hard)
- 5 COMMERCIAL keywords (comparison / "best" intent) the competitor pages rank for
- 5 INFORMATIONAL keywords (blog/content targets) with low difficulty that build topical authority
- The LOCAL keyword formula applied to this business: [service] + [city] + [qualifier] — give 5 examples
- Which single keyword I should target first and why (based on difficulty vs. traffic opportunity)

2. Identify the keyword intent for each primary keyword (Informational / Navigational / Commercial / Transactional) and explain which page type should target each one.

PART 2 — TECHNICAL SEO AUDIT

Audit every technical factor listed below and for each one: state what the issue likely is, why it matters for rankings, and give the exact fix step-by-step.

1. Google Search Console Setup

- Is the domain property verified? If not, walk through DNS TXT record verification
- Is the sitemap submitted? (Check [website URL]/sitemap.xml)
- Are all important pages indexed? Give me the URL Inspection workflow to check and fix
- What indexing errors to look for (Crawled not indexed, Discovered not indexed, 404s, Redirects) and how to fix each

2. Page Speed (Core Web Vitals)

- LCP target: under 2.5 seconds. Common causes and fixes
- INP target: under 200ms. What kills it and how to fix
- CLS target: below 0.1. What causes layout shift and how to prevent it
- Top 5 speed killers for this type of website and the tool to test (pagespeed.web.dev)
- Hosting recommendation for best speed performance

3. Mobile-First Indexing

- Since Google indexes mobile-first, what are the 5 most critical mobile issues to check?
- How to test with Google's Mobile-Friendly Test
- What makes a site fail mobile indexing and how to fix each

4. HTTPS & Security

- Confirm the site runs https:// — if not, exact steps to get SSL certificate
- How to verify in GSC that all pages are secure

5. Site Architecture

- Ideal internal linking structure for this type of website

- How Google uses internal links to determine page importance
- How many internal links should the homepage have and where should they point?
- Anchor text best practices (descriptive vs "click here")

6. robots.txt and Crawl Accessibility

- What should a healthy robots.txt look like for this site?
- Common mistakes that accidentally block Googlebot
- How to check if any pages are being blocked

PART 3 — ON-PAGE SEO OPTIMIZATION

For EACH of the following page types on this website, write the EXACT optimized version of every element listed:

Page Types to Optimize: Homepage, Primary Service Page, Secondary Service Page, About Page, Contact Page

For each page, provide:

1. TITLE TAG (under 60 characters)

Format: Primary Keyword | Secondary Benefit | Brand Name

Write the optimized title tag

2. META DESCRIPTION (under 155 characters)

Must include: primary keyword, a clear benefit, and a call to action

Write the optimized meta description

3. H1 TAG

Must contain exact primary keyword. Must be compelling. Write the H1.

4. H2 TAGS (3-5 section headers)

Include secondary keywords naturally. Write them out.

5. IMAGE ALT TEXT

For the hero image and 3 supporting images — write keyword-rich alt text

6. Image file naming convention

Give examples of proper file names for this business

7. URL Slug

Write the clean, keyword-optimized URL slug for this page

8. Internal Links

Which 3 pages should this page link to, and what should the anchor text say?

9. CTA (Call to Action)

Write a strong closing CTA that matches the buyer intent of this page

PART 4 — CONTENT STRATEGY

1. Build a CONTENT PILLAR STRUCTURE for this website:

- Identify the single most powerful pillar topic (broad guide) this business should own
- Write the pillar page title and H1
- List 8 cluster article topics that branch off the pillar (with target keyword for each)
- Explain how all cluster articles internally link back to the pillar

2. Write 3 FULL ARTICLE BRIEFS (not the articles themselves — the briefs):

Each brief must include:

- Target keyword and monthly search volume
- Search intent (who is searching this and why)
- Recommended word count
- Suggested H1
- H2 section outline (6-8 sections)
- What the competitor's article is missing that yours should include
- CTA at the end of the article

3. CONTENT RULES for this website going forward:

- Minimum word count for ranking articles in this niche
- How to use AI assistance without triggering Google's Helpful Content penalty
- The one thing every article must do in the first 100 words
- Publishing frequency recommendation with realistic rationale

PART 5 — LOCAL SEO (Skip this section if the business is national/global)

1. Google Business Profile Optimization Checklist:

- Every field that must be filled in (with example content for this business)
- Category selection: primary and secondary categories that fit this business
- Photo strategy: what types of photos to post and how often
- Post schedule: how often to post GBP updates and what to write about
- Description: write an optimized 750-character GBP description using primary keywords

2. Review Strategy:

- Write the exact text message/email to send clients asking for a Google review (personalized for this business)
- When to ask (timing after project delivery)
- Follow-up sequence if they don't respond in 3 days
- How to respond to positive reviews (write 3 template responses)
- How to respond to negative reviews (write a professional damage-control response)

3. Citation Building:

- List the top 10 directories this business should be listed on
- Explain the NAP consistency rule and what happens when it's violated

- How to audit and fix inconsistent citations

4. Location Pages (if serving multiple cities):

- Template structure for a location page that will rank
- How to make each city page unique (not just a copy-paste swap)
- Schema markup to add to each location page

PART 6 — SCHEMA MARKUP

Write the exact JSON-LD schema markup code blocks for:

1. LocalBusiness Schema (fill in with the business details provided)

- Include: name, url, telephone, address, geo coordinates, business hours, priceRange, description, sameAs (social links)

2. FAQPage Schema

- Write 5 FAQ questions and answers relevant to this business
- Format as valid JSON-LD ready to paste into the <head>

3. Review/AggregateRating Schema

- Template code assuming the site has testimonials
- Explain how to get star ratings to appear in search results

4. How to verify all schema is working:

- Use Google's Rich Results Test (search.google.com/rich-results)
- Walk through the testing steps

PART 7 — BACKLINK STRATEGY

1. Analyze the competitor URLs provided and explain:

- What types of backlinks are likely powering their rankings
- Their estimated domain authority vs ours
- The content gap between their site and ours (keywords they rank for, we do not)

2. Give me a 30-DAY BACKLINK ACTION PLAN:

- Day 1-7: Quick wins (GBP, social profiles, existing client sites, directories)
- Day 8-14: Guest posting outreach — identify 5 target websites to pitch and write the exact outreach email
- Day 15-21: Skyscraper Technique — find the top-linked competitor article and explain how to build a better version
- Day 22-30: HARO setup and first response — explain the process and write a sample expert pitch

3. Toxic backlink audit:

- How to check for toxic links in GSC (Links section)
- When to use the Disavow Tool and when NOT to

- What types of links to disavow

4. What to NEVER do for backlinks (black hat tactics that trigger Google penalties)

PART 8 — GOOGLE SEARCH CONSOLE MONITORING PLAN

Write a WEEKLY GSC ROUTINE (day-by-day) that includes:

Monday: Performance Report review — what numbers to check, what change triggers action

Tuesday: Indexing errors check — how to interpret and prioritize fixes

Wednesday: Quick-win keyword identification — position 5-20 keywords to push up, with the exact optimization steps

Thursday: Content publishing and re-indexing workflow

Friday: Core Web Vitals review and fix prioritization

Also explain:

- What a healthy CTR looks like for this industry (target %)
- What Average Position benchmarks to aim for month over month
- When to celebrate vs when to panic based on GSC data

PART 9 — COMPETITOR ANALYSIS ACTION PLAN

Using the competitor URLs provided:

1. What to analyze on each competitor's site (title tags, H1s, word count, backlinks, schema, page speed, GBP reviews)
2. Write the Skyscraper Technique execution plan for the competitor's best-performing page
3. Identify 3 content gaps — topics they rank for that this site has zero content about — and turn them into article briefs

PART 10 — 90-DAY RANK #1 EXECUTION ROADMAP

Break it into 3 phases. For each phase give me:

- Specific tasks with priority order (P1 = do first, P2 = do second week, P3 = ongoing)
- Success metrics to hit before moving to the next phase
- Realistic traffic and ranking expectations

MONTH 1 — FOUNDATION:

Goal: Full technical foundation complete. All pages indexed. GBP live and active.

Tasks: [AI generates these based on the audit above]

Success metric: All pages indexed, PageSpeed score above 90, GBP live, sitemap submitted

MONTH 2 — BUILD AUTHORITY:

Goal: First long-tail keyword rankings appear. Traffic begins. 10+ backlinks acquired.
Tasks: [AI generates these]
Success metric: At least 5 keywords ranking positions 1-10, first organic leads coming in

MONTH 3 — COMPOUND AND SCALE:

Goal: Multiple page 1 rankings. Map Pack appearance. Consistent inbound leads from organic search.
Tasks: [AI generates these]
Success metric: Target keyword ranking top 5, Map Pack appearance, 25+ Google reviews, 30+ backlinks

FINAL OUTPUT FORMAT:

Present every section with:

- A clear section header
- Specific, numbered action steps (not vague advice)
- Exact code where applicable (title tags, schema, meta descriptions — written and ready to use)
- A priority label on each task: CRITICAL (do this week) / HIGH (do this month) / ONGOING (do forever)

Do not pad the response with disclaimers or general SEO theory I already know. Every sentence should be either an action I can take, code I can copy, or a specific example I can follow. Go as deep as needed. This is a working document, not a summary.

QUICK REFERENCE: KEY SEO BENCHMARKS

Metric	Target
PageSpeed Score	90+ (mobile & desktop)
LCP	Under 2.5 seconds
INP	Under 200ms
CLS	Below 0.1
Title Tag Length	Under 60 characters
Meta Description Length	Under 155 characters
Article Word Count (to rank)	1,800–2,500 words
CTR Benchmark	2–3% average (fix titles if below 2%)
Google Reviews for Map Pack	25+ with consistent new reviews
Monthly New Articles	4 minimum (1 per week)

Backlinks in 90 Days

30+ quality links

Weekly GSC Check

Every Monday

THE 3 PILLARS GOOGLE RANKS ON

RELEVANCE — Does your page answer the exact search? → Fixed by: Keyword research, on-page optimization, content strategy

AUTHORITY — Do trusted sites link to you? → Fixed by: Backlink strategy, citations, GBP, schema

EXPERIENCE — Does your site load fast and work on mobile? → Fixed by: Core Web Vitals, HTTPS, mobile-first design

Audit of search console data

- ⇔ Technical SEO audit
- ⇔ Page indexing audit
- ⇔ Performance and rendering audit
- ⇔ Content audit
- ⇔ Link audit & brand authority review
- ⇔ User experience & behavioural audit

2. We create segments to analyse where the losses are

- ⇔ Brand vs Non Brand
- ⇔ Sub Folder performance segment
- ⇔ Last 3 months YoY click gap analysis
- ⇔ Pre and post core update loss segment

3. We rule out issues

- ⇒ Spam issues (content, links)
- ⇒ Technical SEO issues
- ⇒ Indexing issues
- ⇒ Content quality, engagement, NLP, value issues
- ⇒ Link quality & accrument issues

4. We identify where the weaknesses are:

Technical SEO:

- ⇒ Page rendering
- ⇒ Internal links
- ⇒ Internal anchors, relevance and consistency
- ⇒ URL constructs and architecture
- ⇒ Directive utilisation
- ⇒ HTTP headers
- ⇒ On page elements

Content:

- ⇒ Content performance by segment
- ⇒ Content quality (writing, style, depth, coverage, tov)
- ⇒ Content age, currentness, accuracy
- ⇒ NLP performance
- ⇒ Engagement performance (scroll, click, engagement metrics)

⇒ Information priority

⇒ Readability

Links:

⇒ Domains with traffic

⇒ Accrueement rate

⇒ Anchor utilisation

⇒ Top page ext RD distribution

⇒ Topical trust flow

⇒ Link network analysis

Indexing:

⇒ Review non indexed page reasons

⇒ Clean up non indexed pages & validate

⇒ Maintain healthy indexing

GSC:

⇒ Review host, robots.txt accessibility

⇒ Review crawl stats

⇒ Review disavows

⇒ Review all data

5. We create a recovery strategy for clients that can run in parrallel so:

- ⇒ Who works on technical fixes, prioritise highest impact items first
- ⇒ Who works on content, we work with & train writers & provide content
- ⇒ Who works on link building / link earning
- ⇒ What strategic items are dealt with first for fastest impact
- ⇒ What's the approval & sign off process
- ⇒ Key KPIs for measurement (query counts, rankings, non brand clicks impr)

6. We then work with clients on:

SEO Implementation:

- ⇒ Get technical fixes done and log annotations
- ⇒ Get content adjustments underway and on a planned schedule
- ⇒ Get link earning underway with a proper link strategy
- ⇒ Get SEO testing underway
- ⇒ Get indexing cleanups done

SEO Measurement:

- ⇒ Log annotations for each thing fixed
- ⇒ Track query counts across URLS, URL Groups and Domain
- ⇒ Track recovery and identify what is and isn't working
- ⇒ Monitor and track new content production
- ⇒ Monitor and track links

Engagement & User Behaviour

- ⇒ Track how people engage with content
- ⇒ Microsoft Clarity + GA4 review
- ⇒ Regular content assessments
- ⇒ UX / content adjustment tests
- ⇒ Maximise positive engagement
- ⇒ Maximise conversion and ROI

We've seen the devastating impact ranking and traffic losses can have on businesses.

We're specialists in ranking & traffic recovery for all types of loss:

- ⇒ Manual actions & penalties
- ⇒ Algo related losses
- ⇒ Spam attacks and hacks
- ⇒ Indexing issues
- ⇒ and lots more

—

the prompt stack

1. GBP category audit

this is where i start with every single client. because if your categories are wrong, nothing else matters.

your GBP has a primary category and secondary categories. most business owners picked their primary category when they created their listing years ago and never touched it again. meanwhile competitors have added secondary categories they didn't know existed - and those categories directly control which searches trigger your listing in the map pack.

wrong categories = invisible for high-intent searches. it's that simple.

the prompt:

why this matters:

i've had clients add one secondary category and start showing up for a whole new set of searches the next week. fastest win in local SEO.

but the real power is pattern recognition. when you map categories against map pack rankings you start seeing things. like every business ranking for "emergency plumber in [city]" also has "water damage restoration" as a secondary category. those patterns are invisible unless you do this analysis. Claude does the gathering. you do the thinking.

2. GBP attributes audit

this one flies under the radar. most people don't even know GBP attributes exist - let alone that they affect rankings and conversions.

attributes are the little tags on your profile. "veteran-owned." "free estimates." "24/7 availability." "accepts credit cards." Google uses these to match searchers with businesses. someone searches "24 hour plumber near me" - Google looks at which GBP listings have the 24/7 attribute. someone searches "woman-owned cleaning company" - same thing.

your competitors have attributes you don't. guaranteed.

the prompt:

why this matters:

attributes are a two-for-one play. they help you rank for more specific searches AND they increase click-through rate because those little tags build trust before someone even clicks your listing.

the "baseline requirements" part is the key insight. if all three top competitors have "free estimates" and you don't - that's not optional. that's table stakes. this audit shows you what's expected in your market versus what's a differentiator.

3. competitor review teardown

reviews are the most visible ranking factor in local SEO. but most business owners look at their competitor's star rating and stop there.

star rating tells you almost nothing. what actually matters is review velocity - how fast they're getting new reviews compared to you. a business with 200 reviews that got 180 of them two years ago is weaker than a business with 90 reviews getting 15 a month. Google tracks this. you should too.

the prompt:

why this matters:

that second tab is your entire review strategy for the next 6-12 months. you'll know exactly how many reviews per month you need.

but here's the deeper insight - look at what customers mention in reviews. the services they name. the neighborhoods they reference. "great furnace install in highland park" is doing SEO work for that competitor whether they know it or not. reviews with keywords and location names are ranking signals. this data tells you exactly what to ask your happy customers to mention.

4. review response strategy

getting reviews is half the battle. how you respond is the other half.

Google has confirmed that responding to reviews improves local ranking. but most businesses either don't respond at all or paste the same "thanks for your review!" on everything.

your review responses are free real estate for keywords and service mentions. and how you handle negative reviews directly influences whether new customers trust you or scroll past.

the prompt:

why this matters:

the template system is the real value here. most businesses struggle with reviews because every response feels like it takes 10 minutes to write. with templates and variations, you respond to any review in under a minute.

and those keyword-rich responses add up. 10 reviews a month, each response mentioning your service and city - that's 120 pieces of keyword-rich content on your GBP per year that you didn't have before.

5. GBP posts strategy

GBP posts are the most underused feature on the platform. most businesses don't even know they exist.

posts show up directly on your listing. they expire after 7 days. and posting consistently signals to Google that your business is active. active businesses get preferred placement.

your competitors probably aren't posting. that's your advantage right now.

the prompt:

why this matters:

the competitor analysis almost always reveals the same thing: nobody's posting. that means consistent posting immediately sets you apart.

but the real play is neighborhood-specific content. every time you publish a post mentioning "just completed a kitchen remodel in [neighborhood]" you're building location relevance. Google sees your business associated with that area. do this across 8-10 neighborhoods every month and you're building local authority that's extremely hard to replicate.

6. services section optimization

Google gives you an entire section to list your services with descriptions. this is prime keyword real estate and almost nobody optimizes it.

most businesses leave it blank or add services with no descriptions. that's like having a landing page with just a title and no content. Google needs text to understand what you do and match you to searches.

the prompt:

why this matters:

your services section is one of the only places on your GBP where you control the text. reviews are written by customers. Q&A can come from anyone. but service descriptions? that's your copy. your keywords. your messaging.

the cross-reference against your website catches a common mistake: businesses add new services to their site but forget to update their GBP. if you do "trenchless sewer repair" but it's not on your GBP, you're invisible for that search in the map pack.

7. GBP description optimization

your GBP description is 750 characters of prime real estate. most businesses waste it.

they either leave it blank, copy-paste from their website, or stuff it with keywords that sound robotic. your description needs to do three things: include your primary keywords naturally, mention your core service areas, and convince someone to choose you over the five other businesses on the screen.

the prompt:

why this matters:

having 3 versions lets you test. run version 1 for 30 days. check impressions and calls. try version 2. most people write one description and forget about it forever. treating it as a testable asset gives you a compounding edge.

8. GBP photo audit

Google has said that businesses with photos get 42% more requests for directions and 35% more click-throughs. but it's not just about having photos - it's about the right photos uploaded consistently.

most businesses uploaded 10 blurry phone pics three years ago and called it done. meanwhile the competitor dominating the map pack uploads weekly and has before-and-after shots that build trust before anyone even calls.

the prompt:

"Open Chrome and go to my GBP listing at [URL] and these competitors: [URL1], [URL2], [URL3]. For each listing, count: total photos, photos uploaded in the last 90 days, types of photos (team, jobs, before-after, office, trucks, equipment), and whether any look like stock photos. Put this in a spreadsheet comparing me vs each competitor. Then give me a specific 8-week photo upload plan for my GBP. Tell me exactly how many photos per week and what type to shoot. Focus on before-afters, team on job sites, trucks in neighborhoods we serve, and close-ups of completed

why this matters:

consistency beats volume. uploading 50 photos in one day then nothing for 6 months tells Google you're not active. uploading 3-5 quality photos every week tells Google your business is alive and thriving.

the type of photos matters. before-and-afters show competence. team photos build trust. trucks in specific neighborhoods signal service areas. the 8-week plan removes the guesswork entirely.

what stays human

this is the part most people get wrong.

Claude Cowork doesn't rank your business. you do.

what it does is eliminate every excuse you had for not doing this work. "i don't have time to analyze competitors." done. "i don't know what categories to add." done. "i don't know what to post." done.

the strategy still requires a human brain. knowing which keywords actually bring in revenue. understanding your local market. reading between the lines of competitor data. figuring out that the reason your competitor ranks isn't their SEO - it's that they've been sponsoring little league teams for 10 years and have backlinks from every local news site in town.

how to use this

don't run all 8 at once. here's the order:

fix the foundation: category audit and attributes audit. fastest fixes with the most immediate ranking impact. you could see changes within days.

optimize your listing: services section, description optimization. this fills your GBP with keyword-rich content Google can index.

- review strategy: review teardown and response templates. now you have a velocity target and a system that turns every review into a ranking signal.

content engine: GBP posts calendar and photo audit. this gives you an ongoing content system that keeps your listing active and builds location relevance week after week.

now stop reading and go run prompt 1.

Add a package.json so it loads on vercel

Universal High-Converting Website Framework

Works for Products, Services, SaaS, Local Businesses, Agencies & E-commerce

1. Sell one thing.

If visitors can't immediately tell what you're selling, they'll leave.

One offer.

One outcome.

One goal.

2. Your hero section should sell the offer.

Most visitors never scroll.

Within five seconds they should know:

- What you sell
- Who it's for
- Why they should care
- What to do next

If your hero can't do that, nothing below matters.

3. Sell the result—not the thing.

People don't buy products.

They buy what the product does.

People don't buy services.

They buy the outcome.

Always sell the transformation.

4. Speak like your customer.

Avoid industry jargon.

Use the exact words your customers use when describing their problems, goals, and frustrations.

If they say it...

You should too.

5. Use numbers instead of opinions.

Don't say:

"The best."

Say:

- Save 5 hours every week
- 4.9★ from 300+ customers
- Delivered in 48 hours
- Trusted by 2,000 businesses

Specific beats generic.

6. One screen. One message.

Every section should communicate one idea.

Trying to say everything at once means nothing gets remembered.

7. Show before you explain.

Photos.

Videos.

Demos.

Examples.

Case studies.

Portfolio.

Screenshots.

People believe what they can see.

8. Build trust before asking people to buy.

Proof comes before persuasion.

Use:

- Reviews
- Testimonials
- Results
- Certifications
- Awards
- Media features
- Before & afters
- Case studies

Trust sells.

9. Make your headline impossible to misunderstand.

If a middle-school student can't explain what you offer after reading it...

Rewrite it.

Simple wins.

10. Give visitors one obvious next step.

Too many buttons create hesitation.

Every page should have one primary action.

11. Your call-to-action should explain what happens next.

Bad:

Get Started

Submit

Continue

Good:

Get My Quote

Book My Demo

Order Now

Start My Free Trial

See Pricing

Reduce uncertainty.

12. Remove unnecessary colors.

Every color competes for attention.

Use one primary brand color to highlight actions.

Everything else should support it.

13. Make your website feel premium.

People judge quality in seconds.

Great spacing.

Great typography.

Great photography.

Consistent design.

Professional websites create confidence.

14. Every section should answer a question.

Who is this for?

What does it do?

How does it work?

Why should I trust you?

Why choose you?

How much?

What happens next?

If a section answers nothing...
Delete it.

15. Handle objections before visitors have them.

Answer questions like:

Is it worth it?

How long does it take?

Will this work for me?

What's included?

What if I'm not satisfied?

Confidence removes friction.

16. Make contacting or buying effortless.

Whether your goal is:

- Buy
- Book
- Schedule
- Apply
- Subscribe
- Request a quote

The path should always be obvious.

17. Show why you're different.

Don't just explain what you do.

Explain why someone should choose you over every alternative.

Different sells.

18. Use real photos whenever possible.

Real products.

Real work.

Real customers.

Real team members.

Real results.

Authenticity builds trust faster than perfection.

19. Keep forms short.

Every extra field reduces conversions.

Only ask for information you truly need.

20. Remove weak words.

Avoid words like:

Leading

Quality

Professional

Innovative

Trusted

Reliable

Show proof instead.

21. Make pricing easy to understand.

Confused buyers don't buy.

Keep pricing simple.

Explain value.

Remove surprises.

22. Use social proof everywhere.

Visitors constantly ask themselves:

"Can I trust this?"

Answer it throughout the website.

Not just once.

23. Speed matters.

A slow website costs sales.

Fast websites feel trustworthy.

Optimize everything.

24. Make navigation effortless.

Visitors shouldn't have to think.

If they have to search for information...

You've already created friction.

25. Create memorable moments.

One unique promise.

One surprising statistic.

One bold guarantee.

One unforgettable visual.

People remember moments—not paragraphs.

26. Give people a reason to act today.

Urgency creates momentum.

Limited availability.

Seasonal demand.

Special pricing.

Production timelines.

Upcoming deadlines.

Waiting should feel expensive.

27. Every page should have proof.

Don't make claims.

Back them up.

Evidence always beats marketing.

28. Design for scanning.

People don't read websites.

They scan them.

Use:

- Clear headlines
- Short paragraphs
- Bullet points
- Icons
- White space

Make information effortless to find.

29. Reduce every unnecessary click.

The fewer steps it takes to complete the goal...

The higher your conversion rate.

30. Make sharing easy.

Even visitors who don't buy today can become marketers tomorrow.

Create pages people want to send to others.

31. Build around one unforgettable promise.

When someone leaves your website, they should remember exactly one thing.

Not ten.

One.

32. Build a website that sells without you.

The best websites answer questions...

Build trust...

Handle objections...

Create desire...

And drive action—

24 hours a day, whether you're online or not.

—

After you design the website do this to each page

You are conducting a WCAG 2.1 AA accessibility audit on my codebase.

CONSTRAINTS:

- Do NOT change visual design, layout, colors, spacing, or UX flows unless a fix specifically requires it for accessibility.
- Make changes as non-invasive as possible — prefer adding/fixing attributes, semantics, and ARIA over restructuring components.
- Preserve all existing functionality and styling exactly as-is.
- If a fix would meaningfully change appearance or behavior, flag it and ask me before applying it.

STEP 1 — STATIC AUDIT

Review the codebase for these common WCAG 2.1 AA issues:

- Missing or improper alt text on images/icons
- Color contrast ratios below 4.5:1 (text) / 3:1 (large text, UI components)
- Missing form labels, or labels not programmatically associated with inputs
- Missing or incorrect ARIA roles, states, and properties
- Non-semantic HTML (e.g. divs used as buttons/links)
- Missing focus indicators or illogical focus order
- Missing skip-navigation links
- Headings not in logical hierarchical order (h1 → h2 → h3)
- Interactive elements not reachable/operable via keyboard
- Missing lang attribute, page titles, or landmark regions

- Time-based content (carousels, auto-playing media) without pause/stop controls
- Error messages not announced to assistive tech

STEP 2 — AUTOMATED TESTING

Set up automated accessibility testing using axe-core integrated with Playwright:

- Add a Playwright test suite that runs axe-core checks (@axe-core/playwright) against key pages/routes
- Fail the test on any "serious" or "critical" violations
- Output a clear report of violations with element selectors and WCAG criteria references

STEP 3 — FIX PRIORITIZATION

List all findings grouped by:

1. Critical (blocks access entirely — e.g. unusable forms, keyboard traps)
2. Serious (major friction — e.g. poor contrast, missing labels)
3. Moderate/Minor (best practice improvements)

For each, propose the minimal code change needed to fix it, and apply fixes incrementally so I can review and test after each batch.

STEP 4 — MANUAL TESTING CHECKLIST

After fixes, give me a manual testing checklist covering:

- Full keyboard navigation (Tab, Shift+Tab, Enter, Esc, arrow keys) through every interactive element
- Screen reader pass (VoiceOver/NVDA) confirming labels, roles, and reading order make sense
- Zoom/reflow test at 200% browser zoom
- Reduced motion / prefers-reduced-motion support check

Start with Step 1 and show me the findings before making any changes.

1. A viral product does not have a free plan

Free users are leeches. They increase support, server costs, and make you build features your paying customers don't want.

Less than 3% of free users ever convert. Remove your free plan.

2. A viral product has three colors

Every color fights for attention. The more colors you add, the less people notice what matters.

Black text. White background. One color for the Buy button.

3. A viral product uses numbers instead of adjectives

“Fast” is forgettable. “Save 4 hours every week” isn’t.

4. A viral product ends with a footer people want to share

97% of visitors won’t buy, but they might share. People remember what they see last.

Finish strong.

5. A viral product treats the OG image as a YouTube thumbnail

“If they don’t click, they don’t watch”. Your OG image is often seen more than your actual website.

Design it like a YouTube thumbnail.

6. A viral product reveals one idea per screen

Don’t try to say everything at once. One screen should communicate one idea and nothing else.

One screen. One message. Just like the Instagram feed.

7. A viral product has a headline a fifth grader can understand

Complexity kills curiosity. Use simple words. Your mum should get it.

8. A viral product has a hard paywall

Signups don't pay the bills. If nobody is willing to pull out their credit card, you don't have validation.

Ask for payment before asking for data.

9. A viral product has copy only you could write

If a competitor could copy-paste your landing page onto their website, your copy is too generic.

Write from experience.

10. A viral product shows the product before it explains it

A demo communicates more than paragraphs of text.

Show. Don't tell.

11. A viral product does one thing

The more things you do, the less people remember. People don't remember Swiss Army knives. They remember the tool that solved their problem.

Be known for one thing.

12. A viral product uses Popcorn Pricing

Your visitors came to buy a product, not study a spreadsheet. Every pricing tier you add creates another decision and another reason to leave.

Keep it to three choices: Good. Better. Best.

13. A viral product rides a wave

Build around trends, technologies, and problems people are already discussing.

The wave does half the marketing for you.

14. A viral product steals its best copy from customers

Customers already describe your product better than you do.

Write like your customers talk.

15. A viral product has a founder people can see and hear

People buy from people. A screen recording from the founder beats a corporate promo video or a wall of features.

Show your face.

16. A viral product makes pricing impossible to miss

The pricing section is one of the first places visitors look. They use it to understand the product, not just the price.

Put “Pricing” in the header.

17. A viral product has a headline people remember the next day

Write five headlines. Show them to friends. Wait 24 hours and ask which one they remember.

Keep the one that sticks.

18. A viral product has an emotional headline

People don't remember features. They remember feelings. Your headline should make people laugh, say wow, or think what the fuck is this.

Write for humans.

19. A viral product does something people have never seen before

Nobody shares another clone. Surprise people.

20. A viral product can be sold from the hero section alone

80% of visitors won't scroll past the hero. If they don't understand the product and want it within a few seconds, you've already lost.

Fix the hero first.

21. A viral product shows empathy before it sells

Before people trust your solution, they need to believe you understand their problem.

Describe the problem better than they can.

22. A viral product has one call to action

Every extra button creates hesitation. When people have multiple paths, many choose none.

Give people one next step. Just one.

23. A viral product has a name people remember

Use words people already know. Avoid wordplay, made-up words, and names that require explanation.

24. A viral product sells a human desire, not a feature

People buy more money, more time, better health, more status, or less pain. Features are just vehicles to get there.

Sell the outcome, not the feature.

25. A viral product lets people try the product before buying it

Don't hide your best features behind a paywall. Put them on the landing page.

Let people play before they pay.

26. A viral product does not use weak words

"most", "many", "rarely" weaken your message because nobody knows what they mean. Strong copy makes clear claims that people can picture, remember, and challenge.

Make statements, not estimates.

27. A viral product does not have a subscription

People already pay for enough subscriptions. Don't add another monthly charge unless you can't ship without it.

One-time payments are 10x easier to sell.

28. A viral product has a call to action that says what happens next

"Get Started" means nothing. "Analyze My Website" tells people exactly what they're about to do.

Remove uncertainty.

29. A viral product does not launch without testimonials

A landing page without testimonials is asking strangers to trust you blindly. Get a few users, friends, or beta testers first and collect their feedback.

Collect proof before traffic.

30. A viral product can be described in under 10 words

If you can't explain your product in one sentence, your users won't either.

31. A viral product compares itself to competitors

People don't care what your product does. They care why they should switch.

Show a simple comparison table with the features your customers care about. Make the decision obvious.

32. A viral product is more expensive than its competitors

Nobody talks about the second cheapest option.

Charge more.

This is what I've learned from 5 years of building 35 startups in public, watching hundreds of launches make \$0, and a few reach millions of people.

These are not rules. They're patterns. Use them as a compass, not a checklist.

Use them as guidance no matter what type of business they are doing this should be a guidance tool use your skills

You are conducting a WCAG 2.1 AA accessibility audit on my codebase.

CONSTRAINTS:

- Do NOT change visual design, layout, colors, spacing, or UX flows unless a fix specifically requires it for accessibility.
- Make changes as non-invasive as possible — prefer adding/fixing attributes, semantics, and ARIA over restructuring components.
